

Tarea 36

1.- Sea un vector $\vec{c}$ que tiene por ángulos directores $\alpha = 90^\circ$, $\beta = 0^\circ$ y $\gamma = 90^\circ$. Determinar los ángulos directores de otro vector que tenga la misma dirección pero sentido opuesto que $\vec{c}$.

$\alpha = 90^\circ$

$\beta = 0^\circ$

$\gamma = 90^\circ$

$\alpha = 90^\circ$

$\beta = 180^\circ$

$\gamma = 90^\circ$

2.- Determinar los ángulos y cosenos directores del vector $\vec{v} = (0, 0, -3)$

$\vec{v} = (0, 0, -3)$

Gráficamente

$\alpha = 90^\circ$

$\cos \alpha = 0$

$\beta = 90^\circ$

$\cos \beta = 0$

$\gamma = 180^\circ$

$\cos \gamma = -1$

Análiticamente

$\cos \alpha = \frac{v_1}{|\vec{v}|} = \frac{0}{3} = 0$

$\cos \beta = \frac{v_2}{|\vec{v}|} = \frac{0}{3} = 0$

$\cos \gamma = \frac{v_3}{|\vec{v}|} = \frac{-3}{3} = -1$

$|\vec{a}| = \sqrt{0^2 + 0^2 + (-3)^2} = \sqrt{9} = 3$

3: Sea un vector unitario $\vec{U}$ del que se conocen dos de sus cosenos directores: $\cos \beta = \sqrt{1/3}$ y $\cos \gamma = 1/2$. Determinar el otro de sus cosenos directores.

$$\sqrt{\cos^2 \alpha + \cos^2 \beta + \cos^2 \gamma} = 1$$

$$\cos^2 \alpha = 1 - \cos^2 \beta - \cos^2 \gamma$$

$$\cos \alpha = \sqrt{1 - \cos^2 \beta - \cos^2 \gamma}$$

$$\cos \alpha = \sqrt{1 - \left(\sqrt{1/3}\right)^2 - \left(1/2\right)^2}$$

$$\cos \alpha = \sqrt{1 - 1/3 - 1/4} = \sqrt{12/12 - 4/12 - 3/12} = \sqrt{5/12}$$

4: Sean los vectores $\vec{a} = (3, -7, 0)$, $\vec{b} = (4, 6, -5)$ y $\vec{c} = (2, -1, 1)$, y el escalar $\gamma = 3$ efectuar las siguientes operaciones.

a) $\vec{a} + \vec{b}$

$$\vec{a} + \vec{b} = (3, -7, 0) + (4, 6, -5)$$

$$\vec{a} + \vec{b} = (3+4, -7+6, 0+(-5))$$

$$\vec{a} + \vec{b} = (7, -1, -5)$$

b) $\vec{a} - \vec{c}$

$$\vec{a} - \vec{c} = (3, -7, 0) - (2, -1, 1)$$

$$\vec{a} - \vec{c} = (3-2, -7-(-1), 0-1)$$

$$\vec{a} - \vec{c} = (1, -6, -1)$$

c) $\gamma \bar{b}$

$$\gamma \bar{b} = 3 \cdot (4, 6, -5)$$

$$\gamma \bar{b} = (3(4), 3(6), 3(-5))$$

$$\gamma \bar{b} = (12, 18, -15)$$

d) $2\bar{a} + \bar{b} - \gamma \bar{c}$

$$2\bar{a} + \bar{b} - \gamma \bar{c} = 2(3, -7, 0) + (4, 6, -5) - 3(2, -1, 1)$$

$$2\bar{a} + \bar{b} - \gamma \bar{c} = (2(3), 2(-7), 2(0)) + (4, 6, -5) - (3(2), 3(-1), 3(1))$$

$$2\bar{a} + \bar{b} - \gamma \bar{c} = (6, -14, 0) + (4, 6, -5) - (6, -3, 3)$$

$$2\bar{a} + \bar{b} - \gamma \bar{c} = (6+4, -14+6, 0+(-5)) - (6, -3, 3)$$

$$2\bar{a} + \bar{b} - \gamma \bar{c} = (10-6, -8-(-3), -5-3)$$

$$2\bar{a} + \bar{b} - \gamma \bar{c} = (4, -5, -8)$$

5.- Sean los vectores $\bar{u} = (2, -3, 5)$ y $\bar{v} = \bar{i} + 2\bar{j} - 3\bar{k}$. Obtener las coordenadas del vector $\bar{w}$ tal que $\bar{u} + 3\bar{v} - \bar{w} = \bar{0}$

$$\bar{w} = \bar{u} + 3\bar{v}$$

$$\bar{w} = (2, -3, 5) + 3(1, 2, -3)$$

$$\bar{w} = (2, -3, 5) + (3, 6, -9)$$

$$\bar{w} = (5, 3, -4)$$

6. Obtener un vector $\vec{T}$ que tenga la misma dirección que $\vec{s} = 2\vec{i} + \vec{j} + 2\vec{k}$, pero con módulo igual a 9 y sentido opuesto a $\vec{s}$.

$$\vec{s} = -2\vec{i} + \vec{j} + 2\vec{k} = (-2, 1, 2) \rightarrow |\vec{s}| = \sqrt{(-2)^2 + 1^2 + 2^2}$$

$$\vec{U} = \frac{1}{|\vec{s}|} (s_1, s_2, s_3)$$

$$|\vec{s}| = \sqrt{4 + 1 + 4}$$

$$|\vec{s}| = \sqrt{9}$$

$$|\vec{s}| = 3$$

$$\vec{U} = \frac{1}{3} (-2, 1, 2)$$

$$\vec{U} = \left(-\frac{2}{3}, \frac{1}{3}, \frac{2}{3}\right)$$

$$\vec{T} = -9 \left(-\frac{2}{3}, \frac{1}{3}, \frac{2}{3}\right)$$

$$\vec{T} = (6, -3, -6)$$
